starox-NACRE17: stellar evolution code

Ian Roxburgh

Domain of applicability: Pre Main Sequence to Post Main Sequence

Basic structure of code

1. Mesh in mass $M(i), i = 0, N; dM(i) = M(i) - M(i-1)$
2. At time t, $V_0(j,i)$ are the structure variables j at mesh point i
   $X_0(k,i)$ the composition variables k at i
3. Guess $V(j,i), X(k,i)$ at $t + dt$ [here taken as $V_0(j,i), X_0(k,i)$]
4. Solve chemistry for $X(k,i)$ at $t + dt$ using $V(j,i), V_0(j,i), X(k,i), X_0(k,i)$
5. Solve structure for $V(j,i)$ at $t + dt$ given $X(j,i), V_0(j,i)$

   Iterate steps 4 and 5 to find $V(j,i), X(j,i)$ at $t + dt$

Structure Variables: $V1 = r,\ V2 = L,\ V3 = \rho,\ V4 = T,\ V5 = P,\ V6 = U, \ldots$
Chemical species: ${}^{1}H,\ {}^{3}He,\ {}^{4}He,\ {}^{12}C,\ {}^{13}C,\ {}^{14}N,\ {}^{15}N,\ {}^{16}O,\ {}^{17}O,\ Z$

Structure equations in form solved in code

$$\frac{\partial M_r}{\partial r^3} = \frac{4}{3}\pi G\rho$$

$$\frac{\partial L_r}{\partial M_r} = \epsilon - \left[\frac{\partial U}{\partial t} - \frac{P}{\rho^2}\frac{\partial \rho}{\partial t}\right]$$

$$\frac{\partial \log T}{\partial \log P}(= \nabla) = \nabla_{rad} \text{ if } \nabla_{rad} \leq \nabla_{ad}, \quad \nabla_{rad} = \frac{3L_r P\kappa}{64\pi\sigma G M_r T^4}$$

$$= \nabla_{con} \text{ if } \nabla_{rad} > \nabla_{ad}, \quad \nabla_{con} \text{ from MLT}$$

$$\frac{\partial T}{\partial r^2} = \nabla\frac{T}{P}\frac{\partial P}{\partial r^2} = -\nabla\frac{T}{P}\frac{GM_r\rho}{2r^3}$$

$P = P(\rho, T, X_1, Z),\ U = U(\rho, T, X_1, Z),\ \nabla_{ad} = \nabla_{ad}(\rho, T, X_1, Z)$

$\kappa = \kappa(\rho, T, X_1, Z),\ \epsilon = \epsilon(\rho, T, X_k, Z)$

Other forms of equations readily implemented

MLT Convective Model as implemented in this code

α is mixing length parameter $\ell = \alpha H$

$$\nabla_{con} = \nabla_{ad} + \Delta\nabla, \quad \Delta\nabla = \left(\frac{2\,\rho B^2}{\lambda P}\right)(x^2 + x)$$

$$B = \frac{48\sigma T^3}{c_p \kappa \alpha^2 H \rho^2}, \quad \lambda = -\left(\frac{\partial \log \rho}{\partial \log T}\right)_P$$

$$x^3 + \frac{4}{9}\left(x^2 + x\right) = \frac{4}{9}\left(\frac{\lambda\, P}{2\,\rho B^2}\right)(\nabla_{rad} - \nabla_{ad}) = W$$

$$H = min(H_p, H_2), \quad H_p = \frac{-P}{dP/dr}, \quad H_2 = \sqrt{\frac{-P}{dP/dr^2}}$$

$$v_{con} = \frac{1}{2}\,\alpha\, B\, x \quad \ell = \alpha\, H, \quad \nu_c = \frac{1}{2}\,\ell\, v_{con}$$

$$\text{Solution for } x: \quad x_1 = \frac{9W}{(8 + 27W)^{2/3}}, \quad x_{k+1} = \left(\frac{W + 2x_k^3 + 4x_k^2/9}{3x_k^2 + 8x_k/9 + 4/9}\right), k = 3$$

Energy generation

$\epsilon = \sum R_{jk} X_k X_j E_{kj}$ Rates R_{kj}, energy/reaction E_{kj}
$R_{kj} X_k X_j$=Number of Reactions/gm/sec of species k with j
Here R_{kj}, E_{kj} from NACRE (usually Adelberger); ν, β decay Bahcall.
Includes iwr fit to weak-intermediate-strong screening.

Equation state and opacity
OPAL GN93 + Alexander opacities, OPAL 2001 state tables.
Generate Ztables on uniform mesh in $VLT = \log_{10} T,\ VLR = \log_{10}(\rho/T^3),\ X_1$
$VLT = 3.30\ (0.05)\ 8.5 \quad VLR = -25.0\ (0.125)\ -17.0 \quad X_1 = 0\ (0.1)\ 1.0$
Data tabulated:
$VLP = \log_{10} P, \quad VLU = \log_{10} U, \quad VLCp = \log_{10} Cp$

$$VLRT = \left(\frac{\partial \log \rho}{\partial \log T}\right)_P, \quad \nabla_{ad}, \quad \Gamma_1, \quad VLK = \log_{10} \kappa$$

Interpolation is by local 4 point cubics with continuous 1st derivatives.
Composition: fixed as in state and opacity tables.

Chemical Evolution

Condensed Nuclear reaction network used in this code

R_{kj} : Number of Reactions/gm/sec of species k with $j = R_{kj} X_k X_j$
E_{kj} : Net energy (ergs) released to gas per reaction of species k with j
includes e^+ anihilation, less ν losses.

$R_{11} : {}^1H\,(p, \nu\ e^+)\,{}^2H(p,\ \gamma)\,{}^3He$
$R_{33} : {}^3He\,({}^3He, \alpha\ 2p)\,{}^4He$
$R_{43} : {}^3He\,(\alpha, \gamma)\,{}^7Be\,(e^-, \nu)\,{}^7Li\,(p, \alpha)\,{}^4He$
$R_{121} : {}^{12}C\,(p, \gamma)\,{}^{13}N\,(\ , e^+\ \nu)\,{}^{13}C$
$R_{131} : {}^{13}C\,(p, \gamma)\,{}^{14}N$
$R_{141} : {}^{14}N\,(p, \gamma)\,{}^{15}O\,(\ , e^+\ \nu)\,{}^{15}N$
$R_{151} : {}^{15}N\,(p, \gamma\ \alpha)\,{}^{12}C$
$R_{151a} : {}^{15}N\,(p, \gamma)\,{}^{16}O$
$R_{161} : {}^{16}O\,(p, \gamma)\,{}^{17}F\,(\ , e^+\ \nu)\,{}^{17}O$
$R_{171} : {}^{17}O\,(p, \gamma\ \alpha)\,{}^{14}N$

Evolution equations

Mixing in convective regions is modelled as a diffusion process with the diffusion coefficient $\nu_c =$ determined by the MLT model of convection.

$$\frac{\partial X_1}{\partial t} = \big[2R_{33}X_3^2 - 3R_{11}X_1^2 - R_{43}X_4X_3 - X_1\ \big(R_{121}X_{12} + R_{131}X_{13} + R_{141}X_{14} + R_{151}X_{15} + R_{151a}X_{15} + R_{161}X_{16} + R_{171}X_{17}\big)\big]m_H + \frac{1}{\rho r^2}\frac{\partial}{\partial r}\left(\rho\nu_c r^2 \frac{\partial X_1}{\partial r}\right)$$

$$\frac{\partial X_3}{\partial t} = \big[R_{11}X_1^2 - 2R_{33}X_3^2 - R_{43}X_4X_3\big]m_3 + \frac{1}{\rho r^2}\frac{\partial}{\partial r}\left(\rho\nu_c r^2 \frac{\partial X_3}{\partial r}\right)$$

$$\frac{\partial X_4}{\partial t} = \big[R_{33}X_3^2 + R_{43}X_4X_3 + R_{151}X_{15}X_1\big]m_4 + \frac{1}{\rho r^2}\frac{\partial}{\partial r}\left(\rho\nu_c r^2 \frac{\partial X_4}{\partial r}\right)$$

$$\frac{\partial X_{12}}{\partial t} = \big[R_{151}X_{15}X_1 - R_{121}X_{12}X_1\big]m_{12} + \frac{1}{\rho r^2}\frac{\partial}{\partial r}\left(\rho\nu_c r^2 \frac{\partial X_{12}}{\partial r}\right)$$

$$\frac{\partial X_{13}}{\partial t} = \big[R_{121}X_{12}X_1 - R_{131}X_{13}X_1\big]m_{13} + \frac{1}{\rho r^2}\frac{\partial}{\partial r}\left(\rho\nu_c r^2 \frac{\partial X_{13}}{\partial r}\right)$$

$$\frac{\partial X_{14}}{\partial t} = \big[R_{131}X_{13}X_1 + R_{171}X_{17}X_1 - R_{141}X_{14}X_1\big]m_{14} + \frac{1}{\rho r^2}\frac{\partial}{\partial r}\left(\rho\nu_c r^2 \frac{\partial X_{14}}{\partial r}\right)$$

$$\frac{\partial X_{15}}{\partial t} = \big[R_{141}X_{14}X_1 - R_{151}X_{15}X_1 - R_{151a}X_{15}X_1\big]m_{15} + \frac{1}{\rho r^2}\frac{\partial}{\partial r}\left(\rho\nu_c r^2 \frac{\partial X_{15}}{\partial r}\right)$$

$$\frac{\partial X_{16}}{\partial t} = \big[R_{151a}X_{15}X_1 - R_{161}X_{16}X_1\big]m_{16} + \frac{1}{\rho r^2}\frac{\partial}{\partial r}\left(\rho\nu_c r^2 \frac{\partial X_{16}}{\partial r}\right)$$

$$\frac{\partial X_{17}}{\partial t} = \big[R_{161}X_{16}X_1 - R_{171}X_{17}X_1\big]m_{17} + \frac{1}{\rho r^2}\frac{\partial}{\partial r}\left(\rho\nu_c r^2 \frac{\partial X_{17}}{\partial r}\right)$$

Surface layers - Atmosphere

No separate atmosphere

Eddington grey atmosphere incorporated in model by imposing surface condition at $R = r(N)$ where optical depth $\tau = \tau_s \sim 0.001$

$$T^4(N) = \frac{L(N)}{4\pi\sigma R^2}\left(\tau_s + \frac{2}{3}\right), \qquad P(N) = \frac{GM(N)}{R^2}\frac{\tau_s}{\kappa(N)}$$

Photosphere determined by iterative interpolation to find the value of R_{ph} where $T = T_{eff}$ with $T^4_{eff} = L(N)/(4\pi\sigma R^2_{ph})$.

Slight error due to height of atmosphere ($\tau \neq \tau_s$)

Interpolate for values of all variables V_j, X_k at R_{ph} and intercalate in the output model.

Convective Core

Boundary of core $M_r = M_c,\ r = r_c$

Relocate nearest mesh point to core boundary

During iterations for structure determine boundary of core M_c where $\nabla_{rad} = \nabla_{ad}$ by interpolation

Move nearest mesh point to core boundary, interpolate values of variables M, dM, V, V_0, X, X_0 on core boundary.

Include $|M_c(it)/M_c(it-1)| < acc$ in convergence condition for structure

Smoothing chemical profile outside shrinking core

Chemical profiles outside *shrinking* core linear in M_r from $M_c(t)$ to $M_c(t+dt)$

Overshooting from convective core, chemical mixing only

Extends mixed region by $\beta\, min(H, r_c)$ setting ν_c constant in overshoot region from r_c to r_{ov}. β adjustable parameter.

Advancing the solution from t to $t + dt$

The basic solution algorithm is implemented as follows

```
1     call predict(M,V,Vo,X,Xo,t,dt,N,Nv,Nm)
      do k=1,kk
           call newxi(M,dM,V,Vo,X,Xo,dt,Z,N,Nv,Nm,kt)
           call Xmodel(M,dM,V,Vo,X,Xo,dt,Z,N,Nv,Nm,it)
           if(it.eq.1) goto 4
      enddo
4     continue
      if(X(1,0).gt.Xend) goto 1
```

subroutine predict sets the time step dt, stores values at t in $X_0(k,i), V_0(j,i)$, predicts $X(k,i), V(j,i)$ at $t + dt$ [here set equal to $X_0(k,i), V_0(j,i)$].

subroutine newxi calculates new values of $X(k,i)$ using the input values of V, V_0, X, X_0. kt is the number of iterations needed in **newxi** for the solution for the new $X(k,i)$ to converge.

subroutine Xmodel then calculates new values of $V(j,i)$ using the input values of V, V_0, X. it is the number of iterations needed in **Xmodel** for the solution for the new $V(j,i)$ to converge.

The cycle is repeated until the solution for the $V(j,i)$ has converged ($it = 1$).

Solving the Chemical equations for $X(k,i)$

The chemical evolution equations are solved as 1st order implicit equations;

$$\left(\frac{\partial X_k}{\partial t}\right)_i = \frac{X_k(i) - X_{ko}(i)}{dt}$$

the diffusion term being expressed in conservative form as

$$-\frac{dt}{\rho r^2}\frac{\partial}{\partial r}\left(\rho\nu_c r^2 \frac{\partial X_k}{\partial r}\right)_i = A_p[X_k(i+1) - X_k(i)] - A_m[X_k(i) - X_k(i-1)]$$

$A_p(i), A_m(i)$, which are the same for all k can be very large in convective regions; in practice they are limited in magnitude for reasons of numerical accuracy. The evolution equations are then written as a set of linear tridagonal equations for each k of the form

$$A_p(i)X_k(i+1) + A_0(i)X_k(i) + A_m(i)X_k(i-1) = S_k(i), \quad i = 0, N$$

where $A_0(i)$ and $S_k(i)$ depend on the values of the of $A_m(i), A_p(i), R_{ij}, V(j,i)$, $X(j,i), X_0(j,i)$ whose current values are known on entry to **newxi**.

An example is the equation for X_3 which is here updated using the code

```
      call rates(V,R11,R33,...
      call difcof(M,dM,V,AP,AM,..

*     advance X3
      do i=0,N
        A0(i)=1-AP(i)-AM(i)+(R33(i)*(X3(i)+X3o(i))+R43(i)*X4(i))*m3*dt
        S(i)=X3o(i)+R11(i)*X1(i)*X1o(i)*m3*dt
      enddo
      Call Tridiag(AM,A0,AP,S,X3,N,Nn)
```

There are several alternative algorithms of 1st order that can be used.

The equations are solved sequentially; that is for each k we solve the system for $i = 0, N$ using a tridiagonal matrix solver, and the set is repeatedly solved with the updated $X_j(i)$ until the solution for the $X_k(i)$ has converged here defined as

$$\sum_i [\delta X_1(i)]^2 + 10^6 \sum_i [\delta X_3(i)]^2 + 10^4 \sum_{k\neq 1,3} \sum_i [\delta X_k(i)]^2 < acc \ (\sim 10^{-10})$$

where δX is the difference in values of X between succesive iterations.

Solving structure equations give X_i

The variables $V(1,i) = r, V(2,i) = L_r, V(3,i) = \rho, V(4,i) = T$; all other state variables are known in terms of these variables and the values of $X(1,i)$ and Z

The time derivatives $\partial Q/\partial t$ are taken as 1^{st} order implict in time, and the differential equations are discretised to 2^{nd} order in space in the form:

$$E(1,i) = [M_{i+1} - M_i] - \frac{1}{2}\left[\left(\frac{dM_r}{dr^3}\right)_i + \left(\frac{dM_r}{dr^3}\right)_{i+1}\right]\left[r_{i+1}^3 - r_i^3\right]$$

$$E(2,i) = [L_{i+1} - L_i] - \frac{1}{2}\left[\left(\frac{dL_r}{dM_r}\right)_i + \left(\frac{dL_r}{dM_r}\right)_{i+1}\right][M_{i+1} - M_i]$$

$$E(3,i) = [T_{i+1} - T_i] - \frac{1}{2}\left[\left(\frac{dT}{dr^2}\right)_i + \left(\frac{dT}{dr^2}\right)_{i+1}\right]\left[r_{i+1}^2 - r_i^2\right]$$

$$E(4,i) = \log\left(\frac{T_{i+1}}{T_i}\right) - \frac{1}{2}\left[\nabla_{i+1} - \nabla_i\right]\log\left(\frac{P_{i+1}}{P_i}\right)$$

The equations are satisfied when $E(k,i) = 0$

The $E(k,i)$ depend on the variables at $V(j,i), V_0(j,i), V(j,i+1), V_0(j,i+1)$, $j = 1, 4$. We iterate to find the values of the $V(j,i)$ that give $E(k,i) = 0$ using a Newton-Raphson technique.

At any given iteration $E(k,i) \neq 0$. We find the derivatives of the $E(k,i)$ wrt $V(j,i), V(j,i+1)$ and solve the linearised equations for corrections $\delta V(j,i)$

$$\frac{\partial E(k,i)}{\partial V(j,i)}\delta V(j,i) + \frac{\partial E(k,i)}{\partial V(j,i+1)}\delta V(j,i+1) = -E(k,i)$$

which can be written as

$$A(k,j,i)\,\delta V(j,i) = -E(k,i)$$

where A is a block diagonal matrix, the blocks being 8 x 4. This system is readily solved by elimination of the first 2 columns in each block, diagonalisation of the 4 x 4 square section of the block, and back substitution. This gives corrections $\delta V(j,i)$ to be added to the $V(j,i)$ This process is repeated until the solution is obtained.

In practice we use $\log V$ rather than V and the solution is deemed to be converged when all corrections $\delta V/V < acc$ ($\sim 1/N^2$).

Parameters for comparison models

For all values of X_1, Z the initial abundances were taken as

$X_3 = 10^{-5}$, $X_{12} = 0.173285\,Z$, $X_{14} = 0.053152\,Z$, $X_{16} = 0.482273\,Z$

$X_4 = 1 - X_1 - Z$, all other $X_k = 0$

All models started on the pre main sequence with a (nominal) initial radius $R_i = 5R_\odot$ except model 1.4 where $R_i = 10R_\odot$. The mesh was $N = 2000$ in all cases; $i = 0, 2001$ with the photosphere intercalated.
