# Richardson extrapolation

# Richardson extrapolation

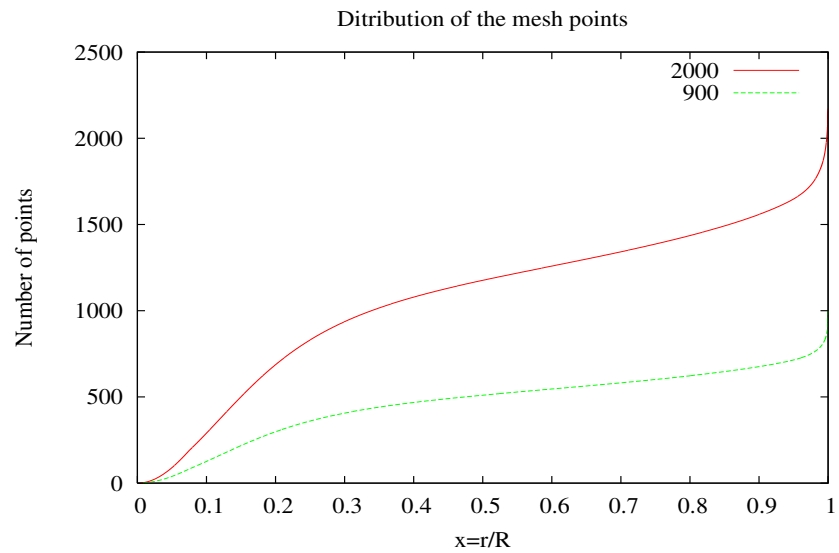

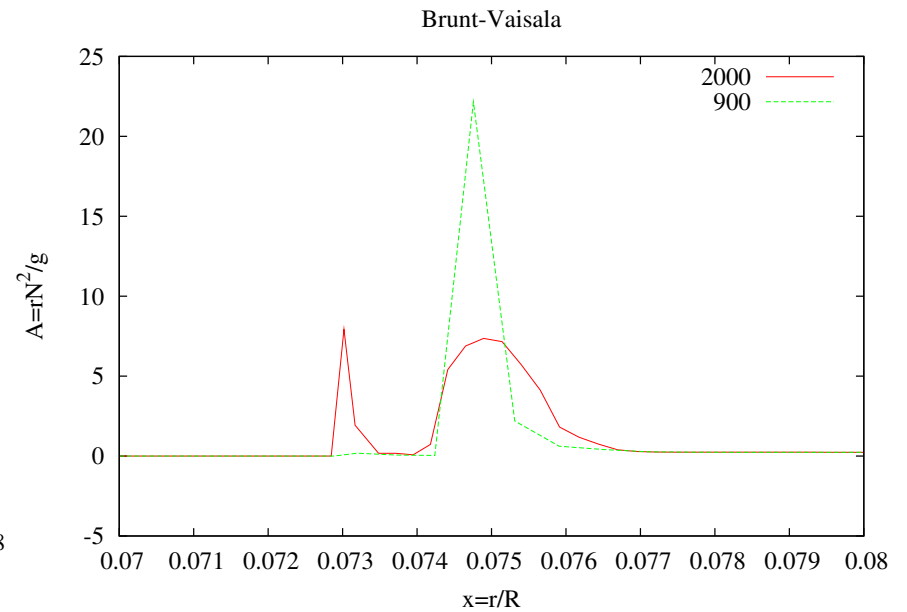

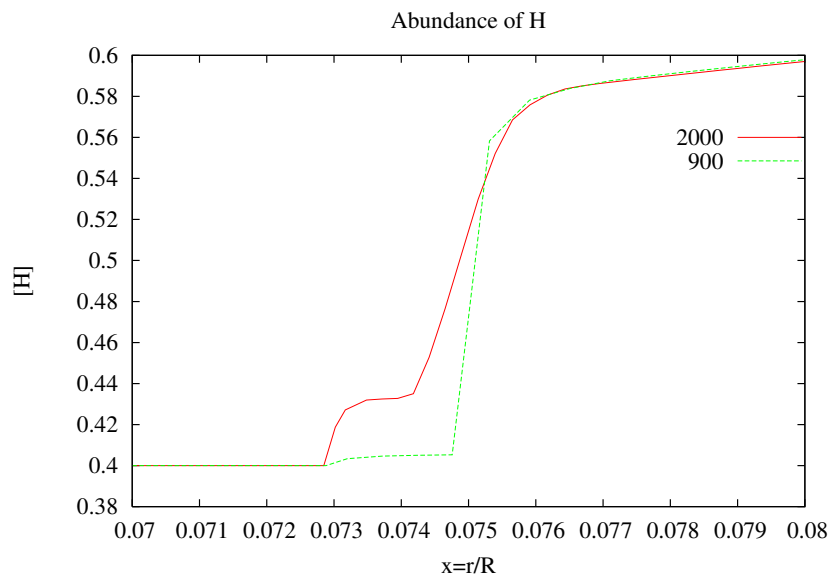

# Conclusions and further work

1. Find an explanation for the differences presented here and away to solve them.
2. Therefore we need to work directly on each particular case.
3. Study other HR diagram positions as  $\beta$  Ceph. or SPB stars.
4. More information and contributions in:  
<http://www.astro.up.pt/corot/compfreqs/task2.html>

## Example about Richardson extrapolation:

	LOC	Graco no RI	GraCo with RI
Frequency $\ell=0, n=23$	2922.45	2925.30	2921.25

$$H_0(\text{FILOU}) = 2924.87 \mu\text{Hz}$$

$$H_0(\text{NOC}) = 2926.8 \mu\text{Hz}$$

$$H_0(\text{ADIPLS}) = 2922.6471 \mu\text{Hz}$$

$$H_0(\text{POSC}) = 2923.2584 \mu\text{Hz}$$

## Example about constant G:

	Graco $G=6.673 \cdot 10^{-8}$	Graco $G=6.67232 \cdot 10^{-8}$	GraCo $G=6.671682 \cdot 10^{-8}$
Frequency H0	254.0617 $\mu\text{Hz}$	254.0482 $\mu\text{Hz}$	254.0356 $\mu\text{Hz}$

$$H0(\text{LOC})=254.0304 \mu\text{Hz}$$

$$H0(\text{NOC})=254.05 \mu\text{Hz}$$

$$H0(\text{ADIPLS})=254.0438 \mu\text{Hz}$$

$$H0(\text{POSC})=254.051 \mu\text{Hz}$$

## Groups with similar behaviors

Frequencies	LOC-ADIPLS- OSCROX (linear)	POSC- OSCROX (cubic)	FILOU-GraCo
Large separation L=0	LOC-ADIPLS- OSCROX (linear)	POSC- OSCROX (cubic)	FILOU-GraCo
Large separation L=1	LOC-ADIPLS- OSCROX (lin)- POSC- OSCROX (cubic)	FILOU-GraCo	
Small separation L=0-2	LOC-ADIPLS- OSCROX (lin)- NOC	GraCo-POSC- OSCROX (cubic)	
Small separation L=1-3	LOC-ADIPLS- OSCROX (lin)- POSC	GraCo-FILOU- NOC	

We need a better knowledge  
about how we treat boundaries  
and the constants used.

Optimize number and distribution  
of mesh points.
